

Separator Services

Professional pollution prevention from the oil and environmental experts

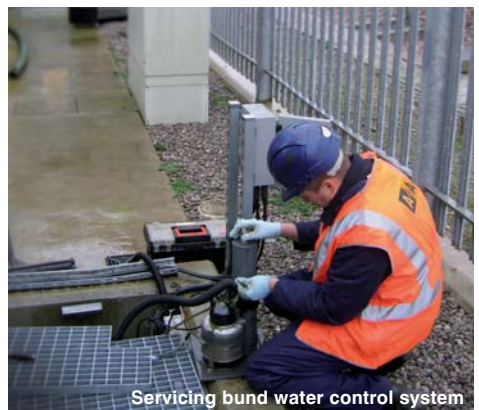

Failed coalescing filters can give rise to pollution incidents

Despite the widespread installation of oil separators (interceptors) in areas of contaminated run-off risk, water courses are still becoming polluted and site owners prosecuted. This can often be attributed to lack of maintenance, faulty parts and on some occasions incorrect installation.

Separator Services will ensure that your pollution prevention measures are working at peak levels of performance keeping the environment clean, and the regulators satisfied.

Expert oil separator surveys, commissioning and maintenance

Financially crippling and environmentally disastrous pollution can be attributed to high levels of silt and sludge in oil separators, saturated filters or blocked safety devices. All these risks can be avoided through the regular maintenance and record-keeping demanded by European Standards. You can trust the expert engineers at Adler and Allan to provide the professional separator services you need to avoid the dangers, and comply with the legislation.

Servicing bund water control system

Specifically designed to satisfy the stringent requirements of Environment Agency/SEPA document PPG3 and European Standard EN858-2, Adler and Allan Separator Services include:

Servicing penstock valve

COMMISSIONING

The entire installation will be checked in detail and, if all the manufacturer's instructions have been adhered to, a certificate will be issued to facilitate formal site handover.

SERVICE

Regular servicing will keep all pollution prevention equipment working at optimum efficiency levels whilst satisfying the need for service log scrutiny during environmental inspections. Adler and Allan offer 1 to 5-year service contracts.

ALARM INSTALLATION

A correctly fitted alarm will reduce the waste management costs of unnecessary emptying whilst ensuring

that overflow is avoided. It is important to remember that this equipment needs to be maintained/serviced.

AUDITS

Adler and Allan will carry out a full site audit on existing separators to identify any issues or potential problems, prior to establishing a service agreement.

STRUCTURAL SURVEY

A full tank Structural Survey should be carried out every five years under pollution prevention guidelines. Adler and Allan engineers will carry out a thorough inspection of your installation and help resolve any issues identified.
